

PART 3 OF 3

Some questions (Assertion–Reason type) are given below. Each question contains **Statement – 1 (Assertion)** and **Statement – 2 (Reason)**. Each question has 4 choices (A), (B), (C) and (D) out of which **ONLY ONE** is correct. So select the correct choice :

Choices are :

- (A) **Statement – 1** is True, **Statement – 2** is True; **Statement – 2** is a correct explanation for **Statement – 1**.
 (B) **Statement – 1** is True, **Statement – 2** is True; **Statement – 2** is NOT a correct explanation for **Statement – 1**.
 (C) **Statement – 1** is True, **Statement – 2** is False.
 (D) **Statement – 1** is False, **Statement – 2** is True.

PROBABILITY

429. $P(E) = \frac{n(E)}{n(S)} = \frac{m}{n}$ or $\frac{\text{Area of } (E)}{\text{Area of } (S)}$ [Good]

Statement-1: Always the probability of an event is a rational number and less than or equal to one

Statement-2: The equation $P(E) = |\sin\theta|$ is always consistent.

430. Let A and B be two event such that $P(A \cup B) \geq 3/4$ and $1/8 \leq P(A \cap B) \leq 3/8$

Statement-1 : $P(A) + P(B) \geq 7/8$

Statement-2 : $P(A) + P(B) \leq 11/8$

431. **Statement-1 :** The probability of drawing either a ace or a king from a pack of card in a single draw is $\frac{2}{13}$.

Statement-2 : For two events E_1 and E_2 which are not mutually exclusive, probability is given by $P(E_1 \cup E_2) = P(E_1) + P(E_2) - P(E_1 \cap E_2)$.

432. Let A and B be two independent events.

Statement-1 : If $P(A) = 0.3$ and $P(A \cup \bar{B}) = 0.8$ then $P(B)$ is $\frac{2}{7}$.

Statement-2 : $P(\bar{E}) = 1 - P(E)$ where E is any event.

433. Let A and B be two independent events of a random experiment.

Statement-1 : $P(A \cap B) = P(A) \cdot P(B)$

Statement-2 : Probability of occurrence of A is independent of occurrence or non-occurrence of B.

434. A fair die is rolled once.

Statement-1 : The probability of getting a composite number is $\frac{1}{3}$

Statement-2 : There are three possibilities for the obtained number (i) the number is a prime number (ii) the number is a composite number (iii) the number is 1, and hence probability of getting a prime number = $\frac{1}{3}$

435. Let A and B are two events such that $P(A) = \frac{3}{5}$ and $P(B) = \frac{2}{3}$, then

Statement-1 : $\frac{4}{15} \leq P(A \cap B) \leq \frac{3}{5}$.

Statement-2 : $\frac{2}{5} \leq P\left(\frac{A}{B}\right) \leq \frac{9}{10}$.

PART 3 OF 3

436. **Statement-1** : Three of the six vertices of a regular hexagon are chosen at random. The probability that the triangle with three vertices equilateral equals to $\frac{3}{10}$.
- Statement-2** : A die is rolled three times. The probability of getting a large number than the previous number is $\frac{5}{64}$.
437. **Statement-1**: A coin is tossed thrice. The probability that exactly two heads appear, is $\frac{3}{8}$
Statement-2: Probability of success r times out of total n trials = $P(r) = {}^nC_r p^r q^{n-r}$ where p be the probability of success and q be the probability of failure.
438. **Statement-1** : For any two events A and B in a sample space $P(A/B) \geq \frac{P(A)+P(B)}{P(B)}$, $P(B) \neq 0$ is always true
Statement-2 : For any two events A and B $0 < P(A \cup B) \leq 1$.
439. **Statement-1**: The letters of the English alphabet are written in random order. The probability that letters x & y are adjacent is $\frac{1}{13}$.
Statement-2: The probability that four cards dealt at random from 94 ordinary deck of 52 cards will contain from an ordinary deck of 52 cards will contain from each suit is $\frac{1}{4}$.
440. **Statement-1**: The probability of being at least one white ball selected from two balls drawn simultaneously from the bag containing 7 black & 4 white balls is $\frac{34}{35}$.
Statement-2: Sample space = ${}^{11}C_2 = 55$, Number of fav. Cases = ${}^4C_1 \times {}^7C_1 + {}^4C_2 \times {}^7C_0$
441. **Statement-1**: If A, B, C be three mutually independent events then A and $B \cup C$ are also independent events.
Statement-2: Two events A and B are independent if and only if $P(A \cap B) = P(A)P(B)$.
442. **Statement-1**: If A and B be two events such that $P(A) = 0.3$ and $P(A \cup B) = 0.8$ also A and B are independent events $P(B)$ is 0.5 .
Statement-2: If A & B are two independent events then $P(A \cap B) = P(A).P(B)$.
443. **Statement-1**: The probability of occurrence of a doublet when two identical dice are thrown is $\frac{2}{7}$.
Statement-2: When two identical dice are thrown then the total number of cases are 21 in place of 36 (when two distinct dice are thrown) because the cases like $(5, 6)$, $(6, 5)$ are considered to be same.
444. **Statement-1**: $A = \{2, 4, 6\}$, $B = \{1, 2, 3, \}$ where A & B are the number occurring on a dice, then $P(A) + P(B) = 1$
Statement-2: If $A_1, A_2, A_3 \dots A_n$ are all mutually exclusive events, then $P(A_1) + P(A_2) + \dots + P(A_n) = 1$.
445. **Statement-1**: If $P(A/B) \geq P(A)$ then $P(B/A) \geq P(B)$
Statement-2: $P(A/B) = \frac{P(A \cap B)}{P(B)}$
446. **Statement-1**: Balls are drawn one by one without replacement from a bag containing a white and b black balls, then probability that white balls will be first to exhaust is $\frac{a}{a+b}$.
Statement-2: Balls are drawn one by one without replacement from a bag containing a white and b black balls then probability that third drawn ball is white is $\frac{a}{a+b}$.
447. **Statement-1**: Out of 5 tickets consecutively numbers, three are drawn at random, the chance that the numbers on them are in A.P. is $\frac{2}{15}$.
Statement-2: Out of $(2n + 1)$ tickets consecutively numbered, three are drawn at random, the chance that the numbers on them are in A.P. is $\frac{3n}{4n^2 - 1}$.
448. **Statement-1**: If the odds against an event is $\frac{2}{3}$ then the probability of occurring of an event is $\frac{3}{5}$.
Statement-2: For two events A and B $P(A' \cap B') = 1 - P(A \cup B)$
449. **Statement-1**: A, B, C are events such that $P(A) = 0.3$, $P(B) = 0.4$, $P(C) = 0.8$, $P(A \cap B) = 0.08$, $P(A \cap C) = 0.28$, $P(A \cap B \cap C) = 0.09$ then $P(B \cap C) \in (0.23, 0.48)$.
Statement-2: $0.75 \leq P(A \cup B \cup C) \leq 1$.
450. **Statement-1**: If $P(A) = 0.25$, $P(B) = 0.50$ and $P(A \cap B) = 0.14$ then the probability that neither A nor B occurs is 0.39 .
Statement-2: $\overline{(A \cup B)} = \bar{A} \cap \bar{B}$

PART 3 OF 3

451. **Statement-1:** For events A and B of sample space if $P\left(\frac{A}{B}\right) \geq P(A)$ then $P\left(\frac{B}{A}\right) \geq P(B)$.

Statement-2: $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} (P(B) \neq 0)$

ANSWER

Details Solution

430. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $\therefore 1 \geq P(A) + P(B) - P(A \cap B) \geq 3/4$
 $\Rightarrow P(A) + P(B) - 1/8 \geq 1/8 \geq 3/4$ (since min. value of $P(A \cap B) = 1/8$)
 $\Rightarrow P(A) + P(B) \leq 1/8 + 3/4 = 7/8$
 As the max. value of $P(A \cap B) = 3/8$, we get
 $1 \geq P(A) + P(B) - 3/8$
 $\Rightarrow P(A) = P(B) \leq 1 + 3/8 = 11/8$. Ans. D
431. (b) Clearly both are correct but statement – II is not the correct explanation for statement – I.
432. (A) $P(A \cup \bar{B}) = 1 - P(\overline{A \cup \bar{B}}) = 1 - P(\bar{A} \cap B) = 1 - P(\bar{A})P(B)$
 $0.8 = 1 - 0.7 \times P(B) \Rightarrow P(B) = \frac{2}{7}$.
433. Statement – II is true as this is the definition of the independent events.
 Statement – I is also true, as if events are independent, then $P\left(\frac{A}{B}\right) = P(A)$
 $\Rightarrow \frac{P(A \cap B)}{P(B)} = P(A) \Rightarrow P(A \cap B) = P(A) \cdot P(B)$.
 Obviously statement – II is a correct reasoning of statement – I
 Hence (a) is the correct answer.
434. Statement – I is true as there are six equally likely possibilities of which only two are favourable (4 and 6). Hence
 $P(\text{obtained number is composite}) = \frac{2}{6} = \frac{1}{3}$.
 Statement – II is not true, as the three possibilities are not equally likely.
 Hence (c) is the correct answer.
435. $\therefore P(A \cap B) = P(A) + P(B) - P(A \cup B) \geq P(A) + P(B) - 1$
 $\therefore P(A \cap B) \geq \frac{3}{5} + \frac{2}{3} - 1 \Rightarrow P(A \cap B) \geq \frac{4}{15} \dots (i)$
 $\therefore P(A \cap B) \leq P(A) \Rightarrow P(A \cap B) \leq \frac{3}{5} \dots (ii)$
 from (i) and (ii), $\frac{4}{15} \leq P(A \cap B) \leq \frac{3}{5} \dots (iii)$
 from (iii), $\frac{4}{15P(B)} \leq \frac{P(A \cap B)}{P(B)} \leq \frac{3}{5P(B)} \Rightarrow \frac{2}{5} \leq P\left(\frac{A}{B}\right) \leq \frac{9}{10}$
 Hence (a) is the correct answer.
436. For statement I, $n(S) = {}^6C_3 = 20$
 only two triangle formed are equilateral, they are $\Delta A_1A_3A_5$ and $\Delta A_2A_4A_6$. $\therefore n(E) = 2$

$$\Rightarrow P(E) = \frac{n(E)}{n(S)} = \frac{2}{20} = \frac{1}{10}. \quad \text{For statement - II } n(S) = 216$$

$$\text{No. of favorable ways} = \sum_{i=1}^6 (i-1)(6-i) = 20$$

$$\therefore \text{ Required probability} = \frac{20}{216} = \frac{5}{64}.$$

Hence (d) is the correct answer.

440. \therefore Reqd. probability = 35/55.

Option (A) is correct.

441. $P\{A \cap (B \cap C)\} = P(A \cap B \cap C) = P(A) P(B) P(C)$

$$\therefore P[A \cup (B \cap C)] = P[(A \cap B) \cup (A \cap C)]$$

$$= P[(A \cap B) + (A \cap C) - P[(A \cap B) \cap (A \cap C)]]$$

$$= P(A \cap B) + P(A \cap C) - P(A \cap B \cap C)$$

$$= P(A) P(B) + P(A) P(C) - P(A) P(B) P(C)$$

$$= P(A) [P(B) + P(C) - P(B) P(C)]$$

$$= P(A) \cdot P(B \cup C)$$

$\therefore A$ & $B \cup C$ are independent events

Ans. (A)

442. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$$P(A \cup B) = P(A) + P(B) - P(A) \times P(B)$$

$$0.8 = 0.3 + P(B) - 0.3 \times P(B)$$

$$P(B) = 5/7$$

'd' is correct.

445. (A) The statement-1 A is true and follows from statement-2

$$\text{indeed } P(A/B) = \frac{P(A \cap B)}{P(B)} \leq P(A)$$

$$\Rightarrow \frac{P(A \cap B)}{P(A)} \leq P(B)$$

$$\Rightarrow P(B/A) \leq P(B)$$

446. Statement-1 is false. Since if the colour white is first to exhaust then last ball must be black.

\Rightarrow favourable sample points

$$((a+b-1)!)b$$

$$\text{req. probability} = \frac{b(a+b-1)!}{a+b!} = \frac{b}{a+b}$$

447. (D) $2n+1 = 5, n = 2$

$$P(E) = \frac{3n}{4n^2-1} = \frac{6}{15} = \frac{2}{5}$$

For a, b, c are in A. P. $a+c = 2b \Rightarrow a+c$ is even

$\therefore a$ and c are both even or both odd.

So, number of ways of choosing a and c is ${}^nC_2 + {}^{n+1}C_2 = n^2$ ways.

$$P(E) = \frac{n^2}{{}^{2n+1}C_3} = \frac{3n}{4n^2-1}$$

448. (B) Both A and R are correct but R is not the correct explanation of A.

449. (A) $\therefore P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C)$
 using all the given values we get that $P(B \cap C) \in (0.23, 0.48)$.

450. (C) Required probability is $P(\bar{A} \cap \bar{B})$

$$= 1 - P(A \cup B) = 1 - [P(A) + P(B) - P(A \cap B)]$$

$$= 0.39$$
