(0755)3200000

- dependent variables is called a DIFFERENTIAL EQUATION.

 A differential equation is said to be ordinary, if the differential coefficients have reference to a single independent variable only and it is said to be PARTIAL if there are two or more single readers and with a primary differential covariable. single independent variable only and it is said to be PARTIAL II there are two or independent variables. We are concerned with ordinary differential equations only.

Finding the unknown function is called **Solving Or Integrating** the differential equation . The solution of the differential equation is also called its **Primitive**, because the differential equation can be regarded as a relation derived from it.

- The order of a differential equation is the order of the highest differential coefficient occurring in it. $\frac{\Omega}{\Omega}$
- The degree of a differential equation which can be written as a polynomial in the derivatives is the general degree of the derivative of the highest order occurring in it, after it has been expressed in a form free from radicals & fractions so far as derivatives are concerned, thus the differential equation:

$$f(x, y) \left[\frac{d^m y}{dx^m} \right]^p + \phi(x, y) \left[\frac{d^{m-1}(y)}{dx^{m-1}} \right]^q + \dots = 0$$
 is order m & degree p.

Note that in the differential equation $e^{y'''} - xy'' + y = 0$ order is three but degree doesn't apply. FORMATION OF A DIFFERENTIAL EQUATION:

If an equation in independent and dependent variables having some arbitrary constant is given, %

The solution of a differential equation which contains a number of independent arbitrary constants equal $\dot{\Phi}$ to the order of the differential equation is called the General Solution (Or Complete Integral Or Somplete Primitive). A solution obtainable from the general solution by giving particular values to the

SHORT THE EQUATIONS OF FIRST ORDER AND FIRST DEGREE DEFINITIONS:

1. An equation that involves independent and dependent variables and the derivatives of the dependent variables is called a Differential equation.

2. Adifferential equation is said to be ordinary, if the differential coefficients have reference to a single independent variables only and it is said to be Parmat. If there are two or more independent variables is called a Differential equation.

2. Adifferential equation is asid to be ordinary, if the differential equation only, eg. $\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} = 0$ is a partial differential equation.

3. Finding the unknown function is called Souther Or International Coefficient occurring in it.

4. The order of adifferential equation is sho called its Parmity, because the differential equation can be regarded as a relation derived from it.

4. The order of adifferential equation which can be written as a polynomial in the derivatives is the degree of the derivative of the highest order occurring in it, after it has been expressed in a form free from radicals & fractions so far as derivatives are concerned, thus the differential equation of the highest order occurring in it, after it has been expressed in a form free from radicals & fractions so far as derivatives are concerned, thus the differential equation in formation of the highest order occurring in it, after it has been expressed in a form free from radicals & fractions so far as derivatives are concerned, thus the differential equation is obtained as follows:

5. The degree of a differential equation of the properties of the adifferential equation is obtained as follows:

6. FORMATION OP A DIFFERENTIAL EQUATION:

6. If an equation in independent and dependent variables having some arbitrary constants is given. The adifferential equation which contains in it. expendent variable (say x) as many times as the number of arbitrary constants in it. expendent variable (say x) as many times as the number of arbitrary constants in it. e Note that the general solution of a differential equation of the nth order contains 'n' & only 'n' independent arbitrary constants. The arbitrary constants in the solution of a differential equation are said to be independent, when it is impossible to deduce from the solution an equivalent relation containing fewer orbitrary constants. Thus the true orbitrary constants. arbitrary constants. Thus the two arbitrary constants A, B in the equation $y = Ae^{x+B}$ are not independent since the equation can be written as $y = Ae^B$. $e^x = Ce^x$. Similarly the solution $y = A\sin x + B\cos(x + C)$

$$dy = r dr$$
 (ii) $dx^2 + dy^2 = dr^2 + r^2 d\theta^2$ (iii) $x dy - y dx = r^2 d\theta$

TYPE-2:
$$\frac{dy}{dx} = f(ax + by + c), b \neq 0.$$

where f(x,y) & $\phi(x,y)$ are homogeneous functions of x & y, and of the same degree, is called Homogeneous. This equation may also be reduced to the form $\frac{dy}{dx} = g\left(\frac{x}{y}\right)$ & is solved by putting y = vx so that the dependent variable y is changed to another variable v, where v is some on the differential equation is transformed to an equation with variables agreed to another variable v.

Consider
$$\frac{dy}{dx} + \frac{y(x+y)}{x^2} = 0$$

If
$$\frac{dy}{dx} = \frac{a_1x + b_1y + c_1}{a_2x + b_2y + c_2}$$
; where $a_1b_2 - a_2b_1 \neq 0$, i.e. $\frac{a_1}{b_1} \neq \frac{a_2}{b_2}$

putting y = vx so that the dependent variable y is changed to another variable v, where v is some with the differential equation is transformed to an equation with variables separable. Consider $\frac{dy}{dx} + \frac{y(x+y)}{x^2} = 0$.

Consider $\frac{dy}{dx} + \frac{y(x+y)}{x^2} = 0$.

The Homogeneous Form:

If $\frac{dy}{dx} = \frac{a_1x + b_1y + c_1}{a_2x + b_2y + c_2}$; where $a_1b_2 - a_2b_1 \neq 0$, i.e. $\frac{a_1}{b_1} \neq \frac{a_2}{b_2}$ then the substitution x = u + h, y = v + k transform this equation to a homogeneous type in the new variables u and v where u had u are arbitrary constants to be chosen so as to make the given by the number of u and u then u a substitution $u = a_1x + b_1y$ transforms the differential equation to an equation with variables separable. and u then u a simple cross multiplication and substituting u and u then u a simple cross multiplication and substituting u for u and u are u and u and u are u and u and u are u are u are u and u are u and u are u and u are u and u are u are u and u are u and u are u are u and u are u are u and u are u and u are u and u are u and u are u are

Consider
$$\frac{dy}{dx} = \frac{x-2y+5}{2x+y-1}$$
; $\frac{dy}{dx} = \frac{2x+3y-1}{4x+6y-5}$ & $\frac{dy}{dx} = \frac{2x-y+1}{6x-5y+4}$

In an equation of the form: $yf(xy) dx + xg(xy) dy = 0$ the variables can be separated by the substitution 8

Get Solution of These Packages & Learn by Video Tutorials on www.Math Consider the example $(x+y)^2 \frac{dy}{dx} = a^2$.

OTYPE-3. HOMOGENEOUS EQUATIONS:

A differential equation of the form $\frac{dy}{dx} = \frac{f(x,y)}{\phi(x,y)}$ where f(x,y) & $\phi(x,y)$ are homogeneous functions of x & y, and of the sar Homogeneous . This equation may also be reduced to the form $\frac{dy}{dx} = g$ putting y = vx so that the dependent variable y is changed to another variable unknown function, the differential equation is transformed to an equation with Consider $\frac{dy}{dx} + \frac{y(x+y)}{x^2} = 0$.

TYPE-4. EQUATIONS REDUCIBLE TO THE HOMOGENEOUS FORM:

If $\frac{dy}{dx} = \frac{a_1x+b_1y+c_1}{a_2x+b_2y+c_2}$; where $a_1b_2-a_2b_1 \neq 0$, i.e. $\frac{a_1}{b_1} \neq \frac{a_2}{b_1} \neq \frac{a_2}{b_$ In an equation of the form: yf(xy) dx + xg(xy) dy = 0 the variables can be separated by the substitution xy = v. **RTANT NOTE:**The function f(x, y) is said to be a homogeneous function of degree n if for any real number f(x, y), we have f(x, y) = f(x, y).

For e.g. $f(x, y) = ax^{2/3} + hx^{1/3}$. $y^{1/3} + by^{2/3}$ is a homogeneous function of degree f(x, y) is a homogeneous f(x, y) is homogeneous f(x, y) is homogeneous f(x,

The fifth order linear differential equation is of the form;
$$a_0(x)\frac{d^ny}{dx^n} + a_1(x)\frac{d^{n-1}y}{dx^{n-1}} + \dots + a_n(x) \cdot y = \phi(x) \cdot \text{Where } a_0(x) \cdot a_1(x) \cdot \dots \cdot a_n(x) \text{ are called the good coefficients of the differential equation.}$$
Note that a linear differential equation is always of the first degree but every differential equation of the α

Teko Classes, Maths: Suhag first degree need not be linear. e.g. the differential equation $\frac{d^2 y}{dx^2} + \left(\frac{dy}{dx}\right)^3 + y^2 = 0$ is not linear, though

The most general form of a linear differential equations of first order is $\frac{dy}{dx} + Py = Q$, where P & Q are

To solve such an equation multiply both sides by $e^{\int P dx}$

It is very important to remember that on multiplying by the integrating factor, the left hand side becomes

Some times a given differential equation becomes linear if we take y as the independent variable of the dependent variable

Some times a given differential equation becomes linear if we take y as the independent variable and x as the dependent variable. e.g. the equation; $(x+y+1)\frac{dy}{dx} = y^2 + 3 \text{ can be written as } (y^2 + 3)\frac{dx}{dy} = x + y + 1 \text{ which is a linear differential equation.}$ **6. EQUATIONS REDUCIBLE TO LINEAR FORM:**The equation $\frac{dy}{dx} + py = Q$. y^n where P & Q functions of x, is reducible to the linear form by dividing it by y^n & then substituting $y^{-n+1} = Z$. Its solution can be obtained as in **Type–5**. Consider the example $(x^3y^2 + xy) dx = dy$.

The equation $\frac{dy}{dx} + Py = Q$. y^n is called **Bernoully's Equation**. **TRAJECTORIES:**Suppose we are given the family of plane curves. $\Phi(x, y, a) = 0$ depending on a single parameter a.
A curve making at each of its points a fixed angle α with the curve of the family passing through that point is called an *isogonal trajectory* of that family; if in particular $\alpha = \pi/2$, then it is called an *orthogonal trajectory*.

Orthogonal trajectories: We set up the differential equation of the given family of curves. Let it be of Ω .

$$\Phi(x, y, a) = 0$$

A curve making at each of its points a fixed angle α with the curve of the ramily passing inrough that points is called an isogonal trajectory of that family; if in particular $\alpha = \pi/2$, then it is called an orthogonal trajectory.

Orthogonal trajectories: We set up the differential equation of the given family of curves. Let it be of of the form F(x, y, y') = 0The differential equation of the orthogonal trajectories is of the form $F(x, y, -\frac{1}{y'}) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The differential equation of the orthogonal trajectories is of the form $\Phi_1(x, y, C) = 0$ The general integral of this equation $\Phi_1(x, y, C) = 0$ The differential equation $\Phi_1(x, y, C)$

$$F(x, y, y') = 0$$

$$F\left(x, y, -\frac{1}{y'}\right) = 0$$

$$\Phi_1(x, y, C) = 0$$

$$xdy + y dx = d(xy)$$
 (ii) $\frac{x dy - y dx}{x^2} = d\left(\frac{y}{x}\right)$ (iii) $\frac{y dx - x dy}{y^2} = d\left(\frac{x}{y}\right)$

$$\frac{x \, dy + y \, dx}{x \, y} = d(\ln xy) \quad (\mathbf{v}) \quad \frac{dx + dy}{x + y} = d(\ln(x + y)) \qquad (\mathbf{vi}) \quad \frac{x \, dy - y \, dx}{x \, y} = d\left(\ln \frac{y}{x}\right)$$

$$\frac{y\,\mathrm{d} x - x\,\mathrm{d} y}{x\,y} = \mathrm{d}\bigg(\ln\frac{x}{y}\bigg) \quad \text{(viii)} \qquad \frac{x\,\mathrm{d} y - y\,\mathrm{d} x}{x^2 + y^2} = \mathrm{d}\bigg(\tan^{-1}\frac{y}{x}\bigg) \quad \text{(ix)} \qquad \frac{y\,\mathrm{d} x - x\,\mathrm{d} y}{x^2 + y^2} = \mathrm{d}\bigg(\tan^{-1}\frac{x}{y}\bigg)$$

$$\frac{x dx + y dy}{x^2 + y^2} = d \left[\ln \sqrt{x^2 + y^2} \right] (xi) \qquad d \left(-\frac{1}{xy} \right) = \frac{x dy + y dx}{x^2 y^2} (xii) \qquad d \left(\frac{e^x}{y} \right) = \frac{y e^x dx - e^x dy}{y^2}$$

$$d\left(\frac{e^{y}}{x}\right) = \frac{x e^{y} dy - e^{y} dx}{x^{2}}$$

(i)
$$\left[\frac{d^2 x}{dt^2} \right]^3 + \left[\frac{dx}{dt} \right]^4 - xt = 0$$
 (ii)
$$\frac{d^2 y}{dx^2} = \left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{3/2}$$

- Obtain the differential equation of the family of circles $x^2 + y^2 + 2gx + 2fy + c = 0$; where g, f & c are arbitary constants.
- Form the differential equation of the family of curves represented by, $c(y+c)^2 = x^3$; where c is any arbitrary constant.

.5
$$\frac{\ln(\sec x + \tan x)}{\cos x} dx = \frac{\ln(\sec y + \tan y)}{\cos y} dy \qquad Q.6 \qquad (1 - x^2) (1 - y) dx = xy (1 + y) dy$$

Q.7
$$\frac{dy}{dx} + \frac{\sqrt{(x^2 - 1)(y^2 - 1)}}{xy} = 0$$
 Q.8
$$y - x \frac{dy}{dx} = a\left(y^2 + \frac{dy}{dx}\right)$$

$$\frac{dy}{dx} + \frac{\sqrt{(x^2 - 1)(y^2 - 1)}}{xy} = 0$$

$$Q.8 \quad y - x \frac{dy}{dx} = a\left(y^2 + \frac{dy}{dx}\right)$$

$$\frac{x dx - y dy}{x dy - y dx} = \sqrt{\frac{1 + x^2 - y^2}{x^2 - y^2}} \quad Q.10 \quad \frac{dy}{dx} = \sin(x + y) + \cos(x + y)Q.11 \quad \frac{dy}{dx} = \frac{x(2\ln x + 1)}{\sin y + y \cos y}$$

Solve:
$$\frac{x dx - y dy}{x dy - y dx} = \sqrt{\frac{1 + x^2 - y^2}{x^2 - y^2}}$$

Get Solution of These Packages & Learn by Video Tutorials on www.MathsBySuhag.com (a) $x^2 dy + y(x + y) dx = 0$, given that y = 1, when x = 1

(b)
$$\left[x\cos\left(\frac{y}{x}\right) + y\sin\left(\frac{y}{x}\right)\right]y - \left[y\sin\left(\frac{y}{x}\right) - x\cos\left(\frac{y}{x}\right)\right]x \frac{dy}{dx} = 0$$

Find the equation of the curve satisfying $\frac{dy}{dx} = \frac{y^2 - 2xy - x^2}{y^2 + 2xy - x^2}$ and passing through (1, -1).

Find the equation of the curve satisfying $\frac{dy}{dx} = \frac{y^2 - 2xy - x^2}{y^2 + 2xy - x^2}$ and passing through (1, -1).

Find the solution of the differential equation $\frac{d^3y}{dx^3} = 8 \frac{d^2y}{dx^2}$ satisfying $y(0) = \frac{1}{8}$, $y_1(0) = 0$ and $y_2(0) = 1$.

Solve: (i) $(x + 3y^2) \frac{dy}{dx} = y$, y > 0 (ii) $(1 + y + x^2y) dx + (x + x^3) dy = 0$ (iii) $\frac{dy}{dx} = y \tan x - 2\sin x$ (iv) $(1 + x^2) \frac{dy}{dx} + 2xy = \cos x$ Solve: (i) $y(x^2y + e^x) dx = e^x dy$ (ii) $x \frac{dy}{dx} + y = x^2y^4$ (iii) $y(x^2y + e^x) dx = 0$ Solve the following differential equations. y(0) = 0, bounding a curvilinear trapezoid with the base y(0) = 0, whose area is propostinal to y(0) = 0, where y(0) = 0, bounding a curvilinear trapezoid with the base y(0) = 0, whose area is propostinal to y(0) = 0, bounding a curvilinear trapezoid with the base y(0) = 0, whose area is propostinal to y(0) = 0, bounding a curvilinear trapezoid with the base y(0) = 0, whose area is propostinal to y(0) = 0, bounding a curvilinear trapezoid with the base y(0) = 0, whose area is propostinal to y(0) = 0, bounding a curvilinear trapezoid with the base y(0) = 0, whose area y(0) = 0. Aparticle, y(0) = 0, so the average y(0) = 0, where y(0) = 0 and y(0) = 0 and y(0) = 0. Aparticle, y(0) = 0, the variety y(0) = 0 and y(0) = 0 are all y(0) = 0 and y(0) = 0 and

Solve :(i)
$$(x + 3y^2) \frac{dy}{dx} = y, y > 0$$

(ii)
$$(1 + y + x^2y) dx + (x + x^3)dy = 0$$

page 28 of 35

(iii)
$$\frac{dy}{dx} = y \tan x - 2\sin x$$

(iv)
$$(1 + x^2) \frac{dy}{dx} + 2xy = \cos x$$

Solve:(i)
$$y(x^2y + e^x) dx = e^x dy$$

(ii)
$$x \frac{dy}{dx} + y = x^2y$$

(iii) 2y sinx dy + (
$$y^2 \cos x + 2x$$
) dx = 0

$$3 \frac{dy}{dx} + \frac{2y}{x+1} = \frac{x^3}{y^2}$$

0 A particle, P, starts from origin and moves along positive direction of y-axis. Another particle, Q, follows P i.e. it's velocity is always directed towards P, in such a way that the distance between P and Q remains constant. If Q starts from (2,0), find the equation of the path traced by Q. Assume that they start moving at the same instant. the same instant.

the same instant.

Let c_1 and c_2 be two integral curves of the differential equation $\frac{dy}{dx} = \frac{x^2 - y^2}{x^2 + y^2}$. A line passing through origin $\frac{c_2}{c_2}$ meets c_1 at $P(x_1, y_1)$ and c_2 at $Q(x_2, y_2)$. If $c_1 : y = f(x)$ and $c_2 : y = g(x)$ prove that $f'(x_1) = g'(x_2)$.

Find the integral curve of the differential equation $x(1 - xy) \frac{dy}{dx} + y = 0$ which passes through (1, 1/e).

Show that the integral curves of the equation $(1 - x^2) \frac{dy}{dx} + xy = ax$ are ellipses and hyperbolas, with the centres at the point (0, a) and the axes parallel to the co-ordinate axes, each curve having one constant axis whose length is equal to 2.

If $y_1 & y_2$ be solutions of the differential equation $\frac{dy}{dx} + Py = Q$, where P & Q are functions of x alone, and $y_2 = y_1 z_1$, then prove that $y_2 = y_3 z_1$, then prove that $y_3 = y_4 z_1$, then prove that $y_4 = y_5 z_1$, then prove that $y_5 = y_5 z_1$, then $y_5 = y_5 z_1$ then $y_5 = y_5 z_1$.

 $z = 1 + ae^{-\int \frac{Q}{y_1} dx}$, 'a' being an arbitrary constant. and $y_2 = y_1 z$, then prove that

Find the curve for which the sum of the lengths of the tangent and subtangent at any of its point is $\dot{\alpha}$ proportional to the product of the co-ordinates of the point of tangency, the proportionality factor is

tangency & the x-axis is bisected at the point of intersection with the y-axis.

A curve passing through (1,0) such that the ratio of the square of the intercept cut by any tangent off the y-axis to the subnormal is equal to the ratio of the product of the co-ordinates of the tangency to the product of square of the square tangency to the product of square of the slope of the tangent and the subtangent at the same point. Determine all such possible curves.

A & B are two separate reservoirs of water. Capacity of reservoir A is double the capacity of reservoir B. Both the reservoirs are filled completely with water, their inlets are closed and then the water is released simultaneously from both the reservoirs. The rate of flow of water out of each reservoir at any ω instant of time is proportional to the quantity of water in the reservoir at that time. One hour after the two water is released, the quantity of water in reservoir A is 1.5 times the quantity of water in reservoir B. After how many hours do both the reservoirs have the same quantity of water? Classes,

A curve y = f(x) passes through the point P (1 ,1). The normal to the curve at P is; a (y-1)+(x-1)=0. If the slope of the tangent at any point on the curve is proportional to the ordinate of the point, determine the equation of the curve. Also obtain the area bounded by the y-axis, the curve [IIT - 1996, 5] & the normal to the curve at P.

f (x) & g(x) are continuous functions. If $u(x_1) > v(x_1)$ for some x_1 and f(x) > g(x) for all $x > x_1$, prove that any point (x,y) where $x > x_1$ does not satisfy the equations y = u(x) & y = v(x).

any point (x, y) where $x > x_1$ does not satisfy the equations $y = u(x_1, x_2) = v(x_1)$.

A curve passing through the point (1, 1) has the property that the perpendicular distance of the origin from the normal at any point P of the curve is equal to the distance of P from the x – axis. Determine the x rift – 1999, 101 [IIT - 1999, 10] equation of the curve.

A country has a food deficit of 10 %. Its population grows continuously at a rate of 3 % per year. Its annual food production every year is 4 % more than that of the last year. Assuming that the average food requirement per person remains constant, prove that the country will become self–sufficient in 0.000

food after 'n' years , where 'n' is the smallest integer bigger than or equal to, $\frac{\ell \, n10 - \ell \, n9}{\ell \, n \, (1.04) - 0.03}$. [IIT - 2000 (Mains) 10]

An inverted cone of height H and radius R is pointed at bottom. It is filled with a volatile liquid completely. If the rate of evaporation is directly proportional to the surface area of the liquid in contact with air (constant of proportionality k > 0) , find the time in which whole liquid evaporates.

[IIT - 2003 (Mains) 4]
